

Expr_command

You are here: [DD-WRT wiki mainpage](#) / [Scripting](#) / [SSH/Telnet & The CLI](#) / [expr](#)

expr is the expression command in bourne type shells. On the WRT, expr is handled by busybox.

expr takes expressions. The most common expressions deal with simple arithmetic operations:

```
~ # expr 5 + 6  
11
```

```
~ # expr 39 / 4  
9
```

Loop counter example:

```
#!/bin/sh  
  
# while lc < 10 do  
  
lc=1  
while [ $lc -lt 10 ] ; do  
    lc=`expr $lc + 1`  
    echo LoopCount: $lc  
done
```

Try **expr --help** for more details.
